

The Concrete Surface Preparation Specialists

- Shot Blasting
- Diamond Grinding
- Scarification
- The Original Glosscrete™ Process

Turning ordinary concrete into GLOSSCRETE™

GLOSSCRETE™ blends today's cutting edge science and technology with yesterday's hard work, quality, and reliability. Our clients are no longer limited to the traditional means of decorative concrete flooring. With our high-speed concrete polishing equipment and factory-trained crews, we transform boring, drab concrete into GLOSSCRETE™, with a mirror-like finish and a variety of stain colors. For further information on the GLOSSCRETE™ process, visit our website at www.shotblastinc.com and go to GLOSSCRETE™.

Expert preparation ... the beginning of every perfect finish

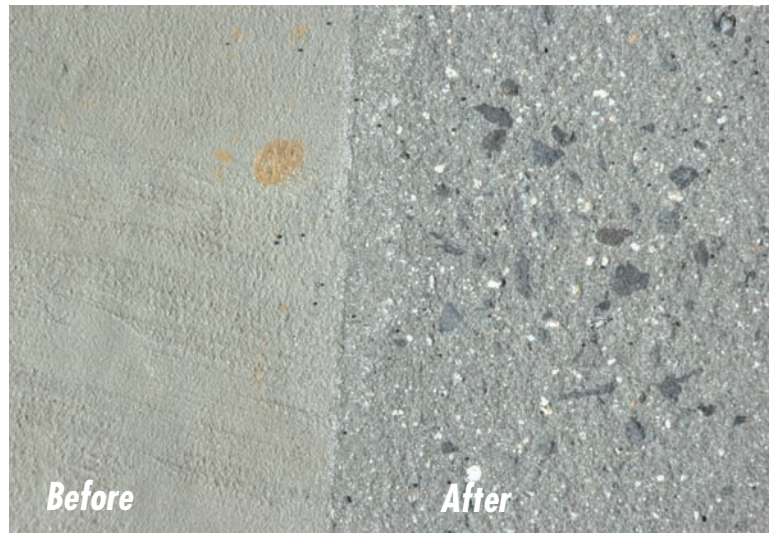

Steel Shot Blasting

Steel shot blasting is the method of surface preparation preferred by most coating manufacturers. It eliminates the use of harsh, non-eco-friendly chemicals and leaves the concrete floor with the desired profile. High production rates, blast pattern accuracy, and wide abrasive selection make steel shot blasting an attractive choice. Disposal of dust and other contaminants is efficient, and shot blasting can be performed indoors or outdoors. Shot blasting can be done with our ride-on, diesel-powered machines or our walk-behind, electric-powered machines.

Applications

- Concrete floor coatings removal (up to 1" concrete removal)
- Concrete floor cleaning
- Steel deck cleaning
- Rubber build-up removal
- Mastic removal
- Epoxy removal
- Sealer removal
- Urethane removal
- Profile concrete
- Texturing for non-slip surface

Diamond Grinding

Diamond grinding will clean and abrade as well as leave the substrate smooth. This method, which can remove thin coatings and mastics and smooth out surfaces on concrete, is perfect for preparing the substrate for very thin applications and sealers. Diamond grinding is suitable for interior and exterior floors; our dust containment system allows us to operate our equipment in a dust-free environment.

Applications

- Cure & Seal
- Lippage or trip hazard removal
- Carpet adhesive removal
- Urethane removal
- Mastic removal

Scarification

When shot blasting and diamond grinding just aren't enough, we use steel or carbide cutters to break or chip away a variety of coating materials. Scarification procedures used on horizontal surfaces can be a highly efficient concrete surface preparation.

Applications

- Urethane removal
- Epoxy removal
- Thermoplastic removal
- Polyurea removal
- Mastic removal
- Concrete floor coatings removal (up to 1" concrete removal)
- Paint removal
- Traffic line removal
- Membrane removal
